BIOLOGICAL TAXONOMY
DATA STANDARD

Standard No.: EX000018.2

January 6, 2006

This standard has been produced through the Environmental Data Standards Council (EDSC).

The Environmental Data Standards Council (EDSC) is a partnership among US EPA, States and Tribal partners to promote the efficient sharing of environmental information through the development and adoption of data standards. More information about the EDSC is available at www.envdatastandards.net.
Foreword

The Environmental Data Standards Council (EDSC) identifies, prioritizes, and pursues the creation of data standards for those areas where information exchange standards will provide the most value in achieving environmental results. The Council involves state and federal agencies, tribes and tribal nations in the development of the standards and then provides the draft materials for general review. Business groups, non-governmental organizations, and other interested parties may then provide input and comment for Council consideration and standard finalization. Draft and final standards are available at http://www.envdatastandards.net.

1.0 INTRODUCTION

This EDSC standard provides data groupings that are used to describe, identify, name, and classify biological taxonomic information for biota, groups, and viruses. The standard specifies the key data elements necessary to constitute consistent and unambiguous identification of biological organisms of interest to environmental concerns.

1.1 Scope

The purpose of the standard is to ensure uniformity and comparability in the identification of biological organisms in the collection, analysis, and exchange of environmental data.

1.2 Revision History

1.3 References to Other Data Standards

This standard does not reference other data standards to make it complete.

1.4 Terms and Definitions

For the purposes of this document, the following terms and definitions apply.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biological Organisms</td>
<td>Biota, groups, and viruses.</td>
</tr>
<tr>
<td>Biological Taxonomy</td>
<td>The science that describes, identifies, names and classifies biological organisms based on degrees of similarity purportedly representing evolutionary (phylogenetic relatedness).</td>
</tr>
</tbody>
</table>
Biota

The biological entities that comprise the taxonomic and nomenclatural standard reference known as the Integrated Taxonomic Information System (ITIS).

Note: For the purpose of this standard, biota is an ecological term that refers to animals, plants, fungi, and other organisms. Biota, in the EPA biological taxonomy standard, does not refer to viruses (see Pollutants definition).

Integrated Taxonomic Information System (ITIS)

A partnership to create a taxonomic and nomenclatural standard reference for biota that promotes scientific excellence and is fully supported by the world taxonomic community. The database is accessible over the World Wide Web (WWW) at http://www.itis.usda.gov/. ITIS classifications conform to the International Code of Botanical Nomenclature and the International Code of Zoological Nomenclature.

Groups (of biological organisms)

Those biota that are regulated as an aggregate of organisms that are related (e.g., macro-invertebrates, minnows, and total coliforms).

ICTVdB

A database that supports virus classification and nomenclature maintained by the International Committee on Taxonomy of Viruses (ICTV).

Name Context

The context in which the name of a biological entity is used, e.g., Registry Name (the unique name assigned to the data element by the Environmental Data Registry -- EDR).

Note: An organism may have more than one name depending on the context in which it is used.

1.5 Implementation

Users are encouraged to use the XML registry housed on the Exchange Network Web site (http://www.exchangenetwork.net) to download schema components for the construction of XML schema flows.

1.6 Document Structure

The structure of this document is briefly described below:

a. Section 2.0 Biological Taxonomy Diagram illustrates the principal data groupings contained within this standard.

b. Section 3.0 Biological Taxonomy Data Standards Table, provides detailed information on the high level, intermediate and elemental biological taxonomy data groupings. Where applicable, for each level of this data standard a definition, XML tag, note(s), example list of values and format are provided. The format column may include the number of characters for the associated data element, where "A" specifies alphanumeric, "N" designates numeric, and "Graphic" designates a diagram or other graphic related binary object.

c. Data Element Numbering. For purposes of clarity and to enhance understanding of data grouping hierarchy and relationships, each data group is numerically classified from the primary to the elemental level.

d. Code and Identifier Metadata: Metadata, defined here as data about data or data elements, that includes their descriptions and/or any needed context setting information required to identify the
origin, conditions of use, interpretation, or understanding the information being exchanged or transferred. (Adapted from ISO/IEC 2382-17:1999 Information Technology Vocabulary—Part 17: Databases 17.06.05 metadata). Based on the business need, additional metadata may be required to sufficiently describe an identifier or a code. A note regarding this additional metadata is included in the notes column for identifier and code elements. Additional metadata for identifiers may include:

- Identifier Context, which identifies the source or data system that created or defined the identifier

Additional metadata for codes may include:

- Code List Identifier, which is a standardized reference to the context or source of the set of codes
- Code List Version Identifier, which identifies the particular version of the set of codes.
- Code List Version Agency Identifier, which identifies the agency responsible for maintaining the set of codes
- Code List Name, which describes the corresponding name for which the code represents

e. Appendix A Biological Taxonomy Data Structure Diagram, illustrates the hierarchical classification of the biological taxonomy data standard. This diagram enables business and technical users of this standard to quickly understand its general content and complexity.

f. Appendix B, lists the references for Biological Taxonomy Data Standard.
2.0 BIOLOGICAL TAXONOMY DIAGRAM

This diagram exhibits the major data groups associated with the Biological Taxonomy Data Standard.

</table>
| 2.12 Biological Species Name        | The systematic name that represents the biological species.                                                                                                                                                 | EDR DE-ID: 20741:1  
A species is a major subdivision of a genus or subgenus and is regarded as the basic division of a genus or subgenus. A species is composed of related individuals that resemble one another and are able to breed among themselves, but are not able to breed with members of another species. | A      | BiologicalSpeciesName        |
| 2.13 Biological Subspecies Name     | The systematic name that represents the biological subspecies.                                                                                                                                               | EDR DE-ID: 20742:1  
A subspecies is a subdivision within a species.                                                                                                                                                     | A      | BiologicalSubspeciesName     |
| 2.14 Biological Synonymous Name     | The name that represents one of two or more names applied to a single biological entity.                                                                                                                     | EDR DE-ID: 20746:1  
Based on the business need, additional metadata may be required to sufficiently describe an identifier. This additional metadata is described in section 1.6.d.                                           | A      | BiologicalSynonymName        |
| 2.15 Program System Biological Name | The name applied to a biological entity in a program system.                                                                                                                                                 | EDR DE-ID: 20748:1  
Based on the business need, additional metadata may be required to sufficiently describe an identifier. This additional metadata is described in section 1.6.d.                                           | A      | ProgramSystemBiologicalName  |
| 2.16 Biological Group Description Text | The text describing the relationship of the biological entities in a group.                                                                                                                                     | EDR DE-ID: 20750:1  
Based on the business need, additional metadata may be required to sufficiently describe an identifier. This additional metadata is described in section 1.6.d.                                           | A      | BiologicalGroupDescriptionText |
